# E. Simple cryptography

Time Limit: 1 seconds

Problem description

Cryptography is the practice and study of hiding information. It is the science used to try to keep information secret and safe. Modern cryptography is a mix of mathematics, computer science, and electrical engineering. Cryptography is used in ATM bank cards, computer passwords, digital signature, communication secure, blockchain, and shopping on the Internet.

Encryption procedure

The encryption function takes 2 parameters. The first parameter – a string - is the original data (called plaintext), and the second parameter – a string - is the key used for encryption (called keyword). The result of encryption function is encrypted text (called ciphertext).

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q	R	S	T	U	V	W	X	Y	Z

Figure 1. Table to encrypt

Each cipher character is obtained by looking up the above table with the encrypted result being the intersection of the row corresponding to the i-th character of the original data with the column corresponding to the i-th of the key. *In case length of key is shorter than original data, the keyword is repeated in a circular manner until it matches the length of the plaintext.*

> *E.g. encrypt(FPTU, ACM) = FRFU*

Because of The first letter of the plaintext, F is paired with A, the first letter of the key. So use row F and column A of the table of encrypt, return F. Similarly, for the second letter of the plaintext, the second letter of the key is used, the letter at row P and column C is R. The rest of the plaintext is enciphered in a similar fashion. The forth letter of the plaintext is U, and the is no forth letter of the key so the keyword is generated by *repeated in a circular manner until it matches the length of the plaintext* – letter A in ACMA. So we look up table to encrypt(U, A)=U

Decryption procedure

Decryption is performed by going to the row in the table corresponding to the key, finding the position of the ciphertext letter in this row, and then using the column's label as the plaintext.

Your task is to determine the outcome of encryption function.

Input:

Line 1: Plaintext in uppercase. Length of plaintext is less than 1000 characters.

Line 2: Keyword in uppercase. Length of keyword is less than plaintext.

Output:

Ciphertext in uppercase.

Example 1:

Input	Output
FPTU ACM	FRFU

Example 2:

Input	Output
